

Instrumentation Rig for calibration training

Designed in partnership with British Energy

The rig can be used to provide initial training to new technicians or apprentices as they can calibrate the instruments in the training centre before having to work on similar instrument on the plant.

Similar training called 'just in time' training can also be carried out which would be relevant if an infrequently performed calibration is to be performed, the item on the rig could be used as a practice calibration before working on the plant.

Because we can put pressure into the rig, we can carry out training to ensure that the instruments are correctly isolated, vented, tested and de-isolated.
