

Valve Actuator Rig

Designed in partnership with British Energy

This equipment is designed to simulate a problem with a valve actuator.

The rig simulates a damaged shaft or faulty universal joint and allows the emergency response teams (IRT/SERT) to practice repair techniques on equipment which is off line but looks similar to the real thing.

- Easily moved on Swivel Brake Castors
- Fitted with truck stops for stability
- The actuators have been replicated to provide realism
- Light Weight construction
