

SERT – D311 Gas Circ- Lube Oil Rig

Designed in partnership with British Energy

This equipment is designed to simulate a Pipework fault in the Lube Oil area of the Gas Circulator.

It allows the Emergency Response Team (IRT/SERT) to practice repairs techniques on equipment which is off line but looks similar to the real thing.

The unit is fitted with truck stops to give it additional stability and is easily moved around for storage on 4 heavy duty lockable swivel castors.

The simulation is painted in colours to match the actual plant onsite to provide the realism required.
