

Pressure Switch Rig

Designed in partnership with British Energy

For use in training technicians who carry out regular maintenance schedule testing on the plant.

During fuel route outages every six months, the operations department are issued with pressure switch calibration checks for the Fuelling machine.

The rig will assist in their initial training and in their continuation training. This rig will allow them to refresh their skills as pressure switch testing only comes around every six months.

The rig can be used to test various types of switches from Delta (various ranges), Sirco and transmitter switches. Operators can also be trained to carry out interspace seal testing on the pressure vessel utilizing the test flange on the rig.

It can also be used to train apprentices and maintenance skills technicians as well.
